

# DENTAL VENEERS: WHAT ARE THE DIFFERENT TYPES?

People having missing or absent teeth in their mouth can feel humiliating and embarrassed. When they have stained, rotten or gapped teeth may feel awful in public due to imperfect teeth.

[Dental Veneers Near Me](#) are an excellent corrective cosmetic means to get an attractive, shiny smile more quickly and easily. Usually, they are made up of tooth-like ceramic substances to correct the imperfections of the teeth including stain, crack, or chip. It is one of the best options for aging having unsightly teeth.

## **What is a Veneer?**

A veneer is also referred to as a laminate process. It is a custom-designed thin layer of ceramic porcelain and composite resin that is applied over the front surface of a tooth for its complete restoration. Consult a **Veneers Dentist** before getting any cosmetic procedure chosen.

**Veneers Houston TX** are designed to match exactly the shape and size of the patients' teeth/teeth. Moreover, they offer the same color as natural teeth. The structure of dental veneers is generally prepared by the technician and delivered to the **Veneers Dentist Near Me** to be applied over the patients' teeth.

## What are the different types?

### Types of Dental Veneers:

There are various types of dental veneers available in the market. The most commonly used are porcelain and composite.

### Porcelain veneers :

They are flat, thin layers of porcelain that are laid over the tooth surface to get rid of the stained chipped, crooked, and badly worn teeth. After installation, you will be able to get a brand new straight radiant smile.

The porcelain veneer process is not technical. The **cosmetic dentist in Houston TX** will evaluate patients' dentition firstly. Then, he/she will take an impression of his/her teeth and send them to the laboratory for veneer fabrication. The most important benefit of implementing a porcelain dental veneer is to get bright, straight, and attractive smiles easily and painlessly.

### Composite resin:

It is an alternative material used for making cosmetic dental veneer. Composite resin is also available in the same color as your natural teeth. This type of veneer does not require the taking of a patient's teeth impressions. There is no specific role of a lab technician in the implementation of this type of veneer. The dentist will remove the tooth enamel and then place the resin material to the surface himself. These veneers are easy to maintain.

Moreover, they are thicker and less expensive than porcelain.

Veneers are really delicate until they are fortified or solidified to the teeth. Once solidified successfully, they will become as strong as or significantly more grounded than your genuine, healthy teeth. The wafer-thin veneers are incredibly more grounded and never or in a rare case become broken or chipped. After [veneers treatment Houston](#), you can enjoy your flawless smile. Whenever taken into consideration, veneers can last for a long time.

- The cost of dental veneers usually depends on the facts including:
- The material made from;
- The location where you live;
- Area of the clinic, you choose
- Qualification of the dentist
- Skills of the technician who will fabricate the veneers on the basis of your teeth impressions.
