

What Is The Process Of Installing Veneers?

Dental veneers are used to enhance your tooth. You can have many dental procedures to improve your tooth and smile. The treatment of dental veneer is easy and is completed within three sessions. Moreover, you will not feel discomfort or pain like other dental procedures. And if you're considering dental veneers, your dentist will likely give you two options: composite veneers or porcelain veneers. Your [Houston veneers specialist](#) will explain both options to you.

Dental veneers are tooth-like-coloured shells that your dentist places on your front tooth to cover and hide cosmetic imperfections, like stained teeth or chipped teeth, by creating the appearance of your teeth whiter and straighter. Visit a dentist who knows dental veneers and can place them accurately on your teeth—the [Best Cosmetic Dentist](#) trained in all cosmetic procedures.

Many people who are new to this procedure may think about how it works and what the treatment exactly is. Here are the steps that can make you feel comfortable during the dental veneer procedure if you are considering dental veneer.

Diagnosis and treatment plan

Before proceeding with the treatment plan, you must consult with the [best cosmetic dentist Houston](#) for your dental issues for what you have come. The dentist will examine your condition and provide the best solution to your problem. The dentist will tell you about the different types of veneers and which suits you best. First, the dentist will ask you what you expect from the treatment plan and guide you with the specific treatment plan. Also, ask for the **dental veneer cost** before the treatment plan.

During the process, the dentist will take an X-ray to make an impression of your teeth to design the dental veneers. The dentist will also check for any issues that may cause problems during the veneer process.

Preparation

In this step, the dentist will prepare the teeth that need veneers. During the procedure, the dentist will remove about half a millimetre of the tooth enamel to place the veneer. This procedure is less invasive and does not cause pain or discomfort.

After making the space on the tooth, the dentist makes an impression for the veneer to fit better on your teeth. The impression is given to the dental lab, and in about four weeks, the veneer is made.

Bonding

Once the dental veneers are ready, your dentist will call you and place the dental veneer on your teeth. The procedure for setting the veneer does not cause any pain. The dentist fits the dental veneer to your teeth to ensure that it works well on your teeth. If not, the dentist will then cut and reshape the veneer according to your teeth' shape and size, and the dentist may polish the dental veneer to give it your teeth shade. The dentist uses special dental cement to polish it.

After the polishing, the dentist applies the bond to the veneer and then places the dental veneer on your teeth. Then the dentist hardens the cement with the help of a special light to make the bond firm to last long. Lastly, the dentist will remove the excess glue from your teeth and check on your biting. Your dentist may recommend a follow-up to ensure that the veneers are effective.

In Conclusion:

Veneers can be an excellent solution for cosmetic dental problems like stained teeth. If you are considering the [Best Veneers for Stained Teeth](#), talk to your dentist and discuss whether you are a good candidate for dental veneers.
