

How Long Do Composite Dental Fillings Remain On Front Teeth?

To prevent your smile from being affected, dentists today would likely suggest tooth-colored composite fillings if you need to repair the [Cavity On Front Tooth](#). However, since metal fillings are the most durable, you might be concerned about how long the filler will stay in the cavity to safeguard your tooth. **Front tooth cavity filling** requires minimal tooth structure removal and readily attaches to your tooth enamel when repairing your teeth. Like metal fillings, composite fillings don't expand or corrode, which makes them advantageous.

However, compared to metal **tooth cavity filling**, which can last over ten years, their lifespan is much shorter, lasting about five to seven years. The durability of these tooth-colored fillings mostly depends on your oral hygiene regimen, where they are positioned in your mouth, what you consume, and behaviors like bruxism. Composite fillings, on the other hand, will protect your tooth if you follow your dentist's recommendations and take care of the fillings.

How to identify and treat cavities in front teeth?

Experts at [emergency dentistry](#) suggest visiting the dentist every six months because you might not be aware that you have a cavity. The best action is to visit your dentist as soon as you find a cavity on a front tooth; deterioration should be okay. If you pay attention to the color of your teeth, you can notice how decay progresses from white spots to light brown or grey teeth.

To avoid a tooth turning dark brown or black at that stage, seek dental care. You or your child could also feel pain or be sensitive to cold, heat, or sweets. Dentists will extract the decayed section of the tooth and fill the cavity with a robust restorative material to cure cavities in the permanent front teeth.

Treating cavities in front teeth with fillings

Cavities in the front teeth can be treated the same as other cavities, typically referring to a filling. The dentist would usually choose porcelain or composite **Front Tooth Filling** as the filling material due to its prominent location in the mouth. They can produce these materials to match the color of the rest of the tooth, in contrast to amalgam fillings that are gold or silver.

A veneer covers the entire front of the tooth. It involves slightly more intrusion than fillings, and the dentist at **Emergency Dentistry Near Me** creates a hole for the filling where the cavity is. They remove a significant amount of enamel from the entire front surface of the tooth to prepare it for a veneer before cementing it.

Does it hurt after having a front tooth filling?

Your tooth may feel unpleasant or sensitive for one or two days following the operation. Mild discomfort is typical and ought to last just briefly. Inform your dentist immediately if you have severe pain or detect any swelling or pus. It could indicate the presence of an infection or the requirement for extra care, such as a root canal. Any sensitivity or minor pain may worsen if you eat or drink something extremely hot or cold.
