

# When Do You Need Dental Fillings for Your Cavities?

This is a result of the way they're equipped for treating any type of holes, and there has been a great deal of progress concerning the different types of fillings accessible separated from the conventional metal fillings that we have been utilized to. If you happen to neglect taking care of your dental health, you probably have a higher chance of developing cavities and other forms of tooth decay.

This will just bring about the improvement of plaque which as a rule harms the enamel, which is the top layer of the tooth that secures the prosperity of the tooth. It is very important to take care of the surface of the teeth as failure to do so will only result in a continuous degradation that will gradually spread to the inner parts of the teeth and lead to [tooth replacement](#).

## **How you can prevent plaque from spreading?**

To prevent it from spreading to the lower layers of the teeth, you should respond to any case of cavity formation that includes delicate tissues and nerves. Try as much as possible to avoid any cavity formation from reaching these areas as this will only result in a worst-case scenario of nerve damage and the eventuality of you losing your teeth.

It is therefore advisable that you maintain frequent visits to the **dentist near me** so they can constantly keep an eye on your dental state. Should the dentist come across an extreme case of a dental cavity, they're likely to treat the cavity by getting rid of the decayed tissue and replace it with a dental filling. This is essentially a special dilling that will protect the tooth from further decay or damage and it has been proven to be quite effective.

### What are the different types of dental fillings?

There are several dental filling options available which you can make use of to improve your cavity problem.

- A good example is amalgam fillings, which have been in use for many years. Amalgam fillings generally involve the use of various elemental metals that are used to cover the affected areas. This has been the traditional cavity **front tooth filling** option that has been in use for many years now and despite other options being discovered, it is still very effective at covering up cavities.
- **Composite fillings front teeth** are the other options used to treat cavity issues. They contain several glasses or quartz components. They are preferred because of the eventual natural look as opposed to the amalgam fillings which can be identified to be fillings. They are also more durable and have fewer chances of being stained.
- For some special cases, the dentist is likely to recommend custom-made [dental fillings Houston](#) that are likely to be effective at your cavity issues. This is a special filling that includes a custom-made inlay that will be used to cover up the affected area. This is just a special case scenario when any of the available filling options don't suit you. The other filling options commonly used by dentists include resin fillings.
