

How To Treat A Tooth Abscess?

A **periodontal abscess** is also known as a tooth abscess, this is a bacterial infection that occurs from a pocket of puss. The abscess may occur because of several reasons and in different parts of the tooth. The tooth abscess takes place on both sides of the tooth root on gums, on the other hand, the periapical abscess happens on the tip of your root.

The tooth might be cured with a discharge and getting away from the infection. Many a time, the situation arises where you need to pull away from the teeth, in contrast, you might be able to save money in the treatment of the root canal.

Let's have a look at the whole article to know more about tooth abscesses.

What is a tooth abscess?

A tooth abscessed is a sack of pus that is prepared in many several parts of a tooth as a result of bacterial diseases. Often this is known as a dental abscess. The abscessed tooth will cause a modest to crucial pain and many a time it radiates near your neck or ear.

If this is left uncured, then the abscessed tooth may turn into a critical, life-threatening situation. So, it is important to visit the **dentist open on Saturday** and Sunday too.

What causes a periodontal or tooth abscess?

The risk of tooth abscess is increased by the following factors-

- Dry Mouth
- Bad dental hygiene
- High sugary diet

What are the signs of a tooth abscess?

Following are the signs or symptoms of tooth abscess-

- Sensations in eating and chewing
- Fever
- Swelling and tenderness in the jaws
- Facing problems while breathing or swallowing
- Severe, continuous, throbbing toothache
- Sensations to cold and hot temperatures

What is the treatment for tooth disease?

The [tooth abscess treatment](#) is done to eliminate the cause of infection and killing of the pus. The following are some possible treatments that may involve-

1. Creating an incision and killing - doing a small cut in the gums to kill the abscess
2. RCT (root canal treatment) - before filling and closing the impacted tooth, this is a process that is performed to eliminate the abscess from the root
3. Teeth elimination - if there is a case, where RCT will not work, then the elimination of teeth is essential

For all the above processes, the dentist will numb your mouth with the help of a local anesthetic. If the situation is critical, then the surgery will be done when you are asleep under an anesthetic. Antibiotics may also be avoided to spread the infection, although they are not in the regular prescribed way.

Also, you may first opt for the **tooth abscess home remedy** for treating your abscess. But when it does not work then you need to go for any of the above-mentioned treatments.

How to prevent tooth disease?

One should always need to keep the teeth and gums healthy to diminish the risk of growing an abscessed tooth. However, it means that you need to brush your teeth at least twice a day normally for 2 minutes, and with the use of interdental floss or brush to clean out the gaps between teeth.

Further, you are always required to prevent rinsing of your mouth with a mouthwash or water after brushing the teeth as it washes you away from the preventive toothpaste.
