Each year, the American Dental Association estimates that 10 million impacted wisdom teeth are removed from 5 million patients. You likely know someone who has successfully undergone the procedure with this volume of surgeries. What can you expect?

## Why these teeth are removed?

The teeth that are located at the farthest corners of your mouth are said to be wisdom teeth sometimes also called third molars. We develop four third molars typically with one on the top and bottom of the right and left sides of the jaw. Erupting through the gums and aligning with the rest of the teeth, sometimes wisdom teeth develop naturally. Some serious dental and health problems can occur, in the estimated 70 plus percent of people where this doesn't happen.

**1. Impaction and bone damage:** When teeth are impacted they may try to grow sideways and cause damage to the jawbone as they work on finding a path to erupt.

**2. Infections:** Bacteria is attracted to the gums when partially erupted teeth can leave openings in the gum. Both minor and serious **wisdom tooth infections** can be caused over time by this bacteria.

**3. Pressure:** Disrupting the natural tooth-grown patterns and orthodontic treatment because impacted teeth can place pressure on other nearby teeth. This will lead to decay and crowding.

**4. Tumors and cysts:** Cysts and tumors can develop around **impacted wisdom teeth**. This complication can result in damage to the jawbone and gums. To avoid any of these complications, the surgical removal of impacted wisdom teeth is the smartest way. Even in the case of asymptomatic teeth, removal is often recommended. Before they cause problems, it's better to remove impacted wisdom teeth and avoid potentially serious complications that develop over time.

### **What to expect from a removal procedure?**

Due to suspected issues with your wisdom teeth, your dentist, orthodontist, or even primary care doctor likely referred you to an experienced oral and maxillofacial surgeon. The surgeon will take detailed X-rays to determine the positioning of your teeth during the initial

consultation. An oral assessment will also be conducted by him or her. A specific course of action will be recommended to you based on findings and an appointment scheduled for the extraction if required. At that time, the doctor will also discuss any potential complications of the procedure.

**wisdom teeth removal** is conducted in the surgeon's office because it is an outpatient procedure. Local anesthesia is used to prevent pain at the removal site in most cases. In partnership with the patient, anesthesia decisions are made with comfort and health considerations in mind.
