

Which Treatment is Good for You, Root Canal or Extraction?

In dental dentistry, root, canal, and tooth extraction is the most common treatment for damaged or infectious teeth. However, comparing both treatments is a tough decision, but here are some points; after knowing them, you can choose which method is best for you.

When Can Teeth Be Saved?

[Orthodontist Houston](#) uses Root canal treatment (RCT) to repair or save damaged, infectious, or dead pulp teeth. The pulp is the core of your teeth, involving blood vessels and nerve tissues. When bacteria reach your tooth's core, it damages your tooth and develops a deep cavity. In this case, your dentist will recommend a for your diseased tooth; root canal treatment involves cleaning your teeth' dead nerves and tissues, and then your dentist uses filling to pack your teeth. If untreated, bacteria reaches the pulp, resulting in infection, swelling, or the dead pulp may become pus. And this situation may infect surrounding teeth and gums.

When Should They Be Extracted?

But sometimes, your dentist can't help you in saving a tooth and remove your infectious and diseased tooth. This may happen when you have a large cavity that can't be treated with restorative procedures. Repairing may not work due to your case's severity or fractured situation's severity and complexity. [Orthodontist Houston tx](#) will remove your tooth to help you with sharp and immense pain. A tooth with a crack that reaches below the gumline is a prime candidate for teeth removal.

Root Canals: Procedure

A [root canal Houston](#) is a relatively simple procedure compared to other restoration procedures. Your dentist will administrate a local anesthetic to the impacted area. After numbing the area, your dentist will open the affected tooth, clean the diseased or dead pulp, and ensure no bacteria are left behind. After cleaning dentist will fill your teeth with "gutta-percha," material and sealant. After it provides extra protection to your teeth, your dentist will recommend a dental crown, strengthening and increasing the filling material's durability. Also, help in restoring the aesthetic look.

Tooth Extraction: Procedure

In case your dentist is unable to save your tooth due to a severe infection to your tooth. Your dentist numbs the area with the help of local anesthesia. Next, they will use lever-like appliances to loosen your diseased tooth. Then forceps will extract the tooth, and you may feel some pressure while this happens, but you will not feel any pain. After extraction, your dentist will place a gauze for up to 30 minutes to clot the blood flow. You may find bleeding about 24 hours after the procedure. The dentist will advise you on soft and cooked food that doesn't irritate the extraction site. But you will gradually get back to your regular diet.

Conclusion

After the proper scan and examination of your mouth, your dentist will recommend you the most appropriate treatment for you if you are worried about the affordability of your dental treatment services. [Root canal cost in Houston](#) and tooth extraction both are affordable as compared to other restoration methods. Selection between root canal or extraction treatment is complex. Still, your dentist will help you to determine the best choice for you and your smile.
