

WHAT ARE DENTAL VENEERS?

Veneers have become a popular choice to help you get the desired look. They are one of the best possible solutions for getting rid of chipped teeth or misshapen teeth.

Dental veneers are thin layers of covering stick to teeth to provide it a more accurate shaped look. **Dental Services Near Me**, provides a variety of [Veneers teeth](#) to make a correct choice. Consult your dentist to know the correct option for you.

Why do you need veneer teeth?

- If your teeth are stained and can't get whitened by bleaching.
- If you have crooked or mishap teeth.
- There are uneven spaces between the teeth.
- Large gaps amid the upper front teeth.

Veneers are made of different materials such as porcelain or composite resin material. The [dentist open near me](#), can help you choose the best one for you. Each kind of teeth veneer has its own benefits.

Porcelain veneers:

A porcelain veneer is a flat, thin covering that is designed to be fitted perfectly on the tooth. These veneers are strong and durable for the long term. Their surface is similar to the natural teeth' surface to provide you a natural look. The possibility of getting stained is less in porcelain veneers.

In the process of preparing teeth, usually, the dentist eliminates the little amount of outer surface from the front and sides of the teeth. That is useful to make enough space for the veneers to get them adjusted so that they may look natural. Then, the dentist takes an impression to create a mold of the prepared teeth. You can also discuss the shade with your dentist to get a perfect smile.

Then he/she will send the impression to a dental laboratory where the professionals will design the porcelain veneers to fit your teeth. This procedure may take multiple days. Meanwhile, you will be provided temporary veneers to put on.

At the next appointment, the dentist will check whether the veneers are well fitted or not. After doing some required adjustments, the dentist will clean the teeth and bond veneers to the tooth.

Composite resin veneers

Composite resin veneers are prepared with a tooth-colored filling material matching with your natural tooth's shade. Professionals apply it in layers to the tooth surface and carved directly in the mouth to get the desired shape.

After the preparation of teeth, the dentist will carefully bond the composite material using the best suitable color for you. Then, he/she will use a laser light to toughen the material and provide a perfect bond to your teeth. After that, the veneers are smoothed and polished to provide a natural look.

Some important facts that should be considered before going to get veneers may include:

- Gums and teeth should be healthy.
- If you have a habit of clenching your teeth, the dentist may recommend a plastic night guard while sleeping.
- Discuss everything about the treatment before getting it done.

After getting veneers, you should avoid biting hard objects for some days because it may cause cracks on them. Maintain oral hygiene by keeping your teeth and gums healthy.

According to cosmetic dentistry, **veneers cost** between \$925 to \$2,500.
