

What should you know about Platelet rich Plasma therapy?

The history of the use of blood and its components for treating people begins more than 1000 years ago. Ancestors of this technique were known in ancient China and India. Doctors of past eras have seen the extraordinary effect of the use of blood in the treatment of inflammatory diseases.

The experience of such treatment was evaluated by the surgeon very positively, however, the introduction of whole blood was accompanied by significant pain. The revival of local blood use occurred in the 80s of the XX century, when American scientists found out those platelets in plasma are responsible not only for blood coagulation, but also for triggering regenerative processes, in general. Today, the idea of using platelet-rich plasma in the form of injections has allowed us to switch to using our patient's own plasma in cosmetology and to "return" to the technique of tissue infiltration with blood components, but at a completely different level - safe and almost painless.

The procedure of plasma therapy has been incredibly popular in recent years in the leading clinics of aesthetic medicine in France, Italy, Switzerland and Israel. For more than 20 years, we at [Platelet Rich Plasma Therapy Boston](#) are using PRP technology to accelerate wound healing in dentistry, maxillofacial surgery, as a therapy for various skin diseases, in orthopedics and cardiovascular surgery. Today, the idea of using platelet-rich plasma in the form of injections has allowed us to switch to using our patient's own plasma in cosmetology and to "return" to the technique of tissue infiltration with blood components, but at a completely different level - safe and almost painless.

Procedure of plasma therapy
