

# Why Top Take Botox Wrinkle Treatment

Botulinum therapy based on purified Botulinum toxin type A is a proven way to eliminate and prevent wrinkles. Correction of facial wrinkles with Botox, Dysport and Xeomin is an effective and safe procedure if carried out in a reliable center with a qualified specialist.

## Advantages of the [Botox treatment in Boston](#):

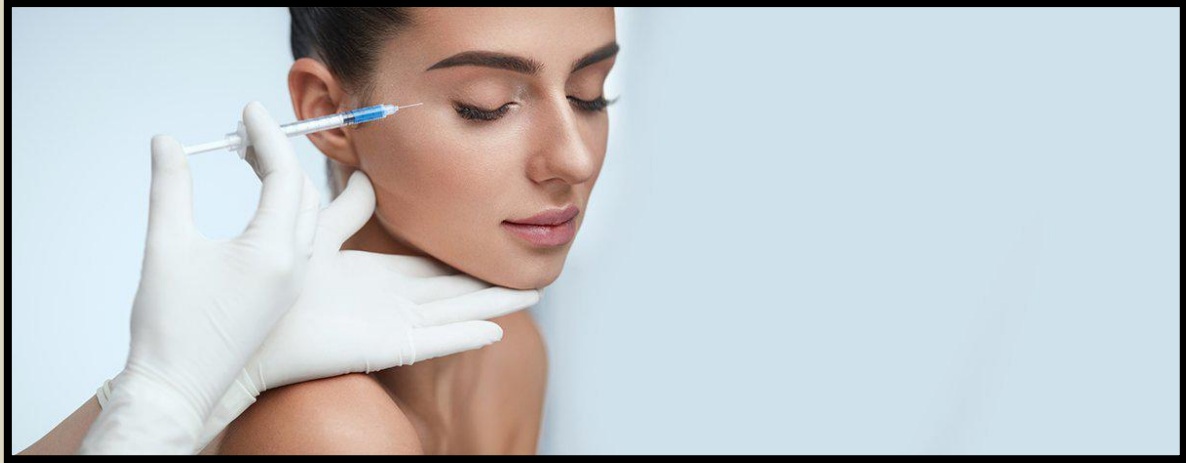

### Principle of action of botulin therapy

The action of injections is based on blocking nerve impulses, which provides lasting muscle relaxation that lasts for a long time. As a result of Botox wrinkle correction, the skin over the muscle is smoothed out, the usual creases and folds are no longer formed, and soon they “erase” and become invisible.

### Drugs for botulin therapy

At the Botox centre, Boston only reliable and proven drugs for Botulinum therapy are used: Botox, Dysport, and Xeomin.

All of them have proven effectiveness and are properly certified. Of course, Botox from Allergan (USA) is today the “gold standard” of Botulinum therapy. But Xeomin or Dysport from facial wrinkles under the eyes and on the forehead is now no less popular than Botox. It should be remembered that only a [Doctor for Botox](#) with sufficient experience with each of them can choose the necessary drug **indications for botulin therapy**:

Xeomin, Botox and Dysport are pricked in nasolabial wrinkles to improve the condition of the middle third of the face. Botox is also effective against wrinkles under the eyes (eliminates crow's feet in the corners of the eyes). Other indications are:

- facial wrinkles on the forehead, between the eyebrows, on the nose, on the temples;
- facial wrinkles of the lower third of the face: "puppet wrinkles" in the chin area;
- wrinkles in the perioral zone (around the lips);
- Prevention of wrinkles by timely correction of excess facial expressions.

### **How is the procedure going?**

Correction of wrinkles with Botox (and other drugs based on Botulinum toxin) takes about 10-20 minutes, and there is virtually no rehabilitation as such, so this procedure can be planned even during the break of the working day.

The first stage is determining the points of administration of the drug. This stage is very responsible, since the doctor needs to have a deep knowledge of anatomy in order to determine the correct points that will correct the excess facial expressions without distorting it. The exact eye and experience of the doctor is important here.

### **Preparations for Botulinum therapy:-**

#### **Preparation for the procedure, rehabilitation, contraindications:**

A few days before you decide to remove wrinkles with Botox, you should avoid taking certain medications and alcohol says **Doctor for Botox**. After correction, a small swelling at the injection site can be observed for several hours - it passes quickly and independently.

The drug "rises" on 2-4 days (there is a change in facial expressions, noticeably smoothing of the skin). The effect is fully manifested after two weeks and can last up to 10 months. To fix the result for a long time, you should repeat the procedure as soon as you feel that the excess facial expressions begin to return.
