

# WHY DO YOU NEED A DENTAL CROWN?

Crowns can be complicated. Unlike other dental difficulties you may experience, it can be really tough to tell when a crown is asked for.

## What Is a Dental Crown?

A tooth consists of two sections called the **root canal** and the **tooth crown**. The root is the section of the tooth that rests under the gumline. The [dental crown](#) is the noticeable part that endures over the gumline.

When you get a **dental crown**, the **dentist near me** cements a natural-colored cap on top of your tooth to guard it or to enhance its appearance, purpose, or form. By getting the **tooth crown** done, the dentist restores your tooth, restoring its structural integrity so its well-being is renewed.

## What Are Signs You May Need a Dental Crown?

If you are encountering any of the following, you may need a **tooth crown**:

1. **Large Filling:** During a filling, the dentist removes the weakened part of a tooth, rinse the space out, and then use a filler substance to fill the decay. If the filling is deep, the residual tooth region is weak and likely to fracturing. In such cases, a **dental crown** to preserve the tooth from stress and cracks is used.
2. **Defective Cusps:** Cusps are the pointy portions of your teeth that are used for ripping food. Hardly cusps tear off and when that happens, the teeth need to be protected the tooth by putting a **tooth crown**.

3. Extreme damage: at times patients have decayed teeth due to grinding, acid reflux condition, bulimia, or a highly acidic diet. In cases like these, the bite can collapse. Then the dentist adds a **dental crown** to replace teeth to the regular size.
4. Appearance: Most of the patients go for **tooth crown**, because they want to transform the appearance of their teeth. Crowns can be utilized to modify the shape or color of a tooth, and they can also be utilized to reduce the presence of gaps between teeth.
5. **Root Canal**: A tooth is hollowed out in a **root canal**. As an outcome, the leftover tooth area is weakened.
6. **Implants**: When a patient takes **implant services**, they will originally have spaces from missing teeth. **Implants** Crowns are then utilized to pack the spaces left from those missing teeth.

What is a **dental crown** made from?

Crowns are composed of various sorts of elements. Metal alloys, ceramics, porcelain, composite resin, or mixtures of these elements may be utilized. In the process of creating a crown, the element usually is shaded to mix in with your natural teeth. Your dentist needs to build a **tooth crown** that seems natural and fits pleasantly in your mouth. To pick on the element for your crown, your dentist will consider the tooth position, the location of the gum tissue, the patient's choice, the number of teeth that expose when you smile, the color or shade of the tooth, and the purpose of the tooth.
