

WHAT EXACTLY HAPPENS IN THE ROOT CANAL TREATMENT?

Root canal treatment, popularly known as root canal therapy, is a method employed to heal issues of the teeth that are not there on the surface, rather on the dental pulp. It is a way to correct the situation might ask otherwise for tooth extraction.

The whole root canal treatment could take two or three visits to your dentist or Endodontist, (root canal specialist) or in the **Root Canal Recovery**, you can take assistance from the [Emergency Dentist](#). Throughout treatment, the contaminated pulp is removed and the pulp chamber and root canals inside your tooth get cleaned and healed.

The root canals treatment is mainly focused on removing pulp inside the teeth, furthermore, a healthy and robust tooth contains the important (live) pulp tissues. The pulp is comprised of generally nerves and veins. The nerves inside the tooth are responsible for communicating sensations of torment and temperature inside the tooth. Root canals are of singular shapes and sizes inside the tooth. They can likewise change between various gender, race, or genetics and they may change because of the age factor. These factors also revolve around **how long does a root canal take to heal?** Well generally it takes 14 days to heal the root canal. The severity of the case might change the duration of healing.

Root canal procedure is the extraction of dead or contaminated nerves and tissue from the interior of your tooth's pulp body. Under the composition root of every tooth is a complex

structure of nerves, with pulp enclosing and preserving the nerve structure and nutrients to the blood supply that stretches out in the whole teeth to make it healthy and sound. This space where all these activities are taking place is known as root space. It takes the maximum **root canal recovery time** in the entire procedure.

In the procedure of the root canal treatment drilling a tiny hole in the tooth, extracting the nerve structure, nutrient supply, and pulp. The root canal is then disinfected, formed, sterilized, and once the root and canal space is completed with the procedure. The hole made in the tooth gets sealed with the material as regarded best by the dentist. A root canal is a restoration of the inside of teeth structure and is the only option for fixing the internal tooth nerve loss or tooth canker besides getting the whole tooth extracted.

Root canal treatment keeps you saved from tooth replacement whereas in the cases the last option is to lose your teeth. Once the process of contamination has started it will get spread in your whole mouth, there is no other way out. Bacteria have a tendency to get multiplied and taking the whole tooth down.
