

# WHAT ARE THE PROCEDURES, BENEFITS, AND COST OF DENTAL IMPLANTS?

When dental patients hear the words dental implants they become concerned about it. These restorative devices should not be so intimidating. [Dental implants houston](#) uses them to support dental health and preserve people's abilities to chew, talk and otherwise enjoy life.

## **What are Dental Implants?**

Dental implants are typically made from titanium today. To take the place of teeth and their roots they are surgically inserted into the jaw. Additionally, implants do much more than simply sit in place of dental structures. They support the surrounding teeth as well. Implanted into the jaw, they support various other dental prosthetic devices, such as **dental crowns**, **dental bridges**, and dentures.

## **Dental Implant Procedure**

Before an implant procedure, there is a lot of preparation, dental patients may notice this. The **dental implant specialist** must identify the exact location, form, and structure of the jaw and mouth. For example, depending on the future location of the implant, he may need to identify the proximity of the sinus cavity or the inferior alveolar nerve canal in the jaw. Aside from the usual dental X-rays, CT scans of the area may be required as well. It is important to know the exact shape of the jaw and the amount of bone that can support the

implants in order to avoid complications but also to prepare an implant that will fit exactly in place.

Once the planning has been finished, the **dental implant specialist** can begin the actual procedure. It is necessary to make some sort of incision into the gums over the place where the implant will be inserted. Without any other permanent adornment, the implant is set in place. It must be given time to let natural bone grow over it and set it in place firmly. Then, a prosthodontist can place crowns or other prostheses over the implant.

### **Recovery from Dental Implant**

There is a great deal of debate over the proper amount of recovery time required to let the [cosmetic dental implants](#) heal properly before placing a prosthesis on it. The general practice is to allow anywhere from two to four months for healing before adding the stress of a prosthesis, or four to six months if bone grafting is involved. In very selected cases, a temporary prosthesis can be inserted on the same day of implant placement, possible if certain clinical criteria are meant.

### **Benefits Of Dental Implants**

There are many important advantages of having implants that have made them incredibly popular. Here are some of the major benefits a **dental implant dentist near me** gives:

1. **Permanent Tooth Replacement-** Dental implants are rooted in the jawbone making them strong, stable, and very durable. Implants provide a stable and permanent solution to tooth loss and may last a lifetime.

2. **Flexibility**- Dental implants can be used in union with other restorative dental procedures. For instance, implants can give retention and stability to dentures and also lessen irritation to the gums.

3. **Natural Appearance**- Dental implants look, function, and feel just like natural teeth. It is almost impossible for the untrained eye to distinguish between dental implants and natural teeth.

### **Dental Implant Cost**

Depending on the region and who is performing the procedure, the cost of a single dental implant can vary. For a single dental implant, the conservative estimate cost is \$3000-\$4000. This cost includes all the components, the implant crown, and the surgery for placement of an implant.
