

# *What Exactly Are Dental Implants?*

The dentist who does **dental implants near me** says that dental implants are the replacement of artificial tooth roots made from metal like titanium. They provide a strong foundation for removable or permanent teeth that are made to match your natural teeth. Some patients have attachments on their implants instead of individual crowns that support a removable denture. An **emergency dentist near me** explains that dental implant surgery is a procedure that replaces tooth roots with metal. The screw-like posts replace the missing or damaged teeth with an artificial crown that appears and functions like natural teeth.

## How to choose between dentures and implants?

In case you have to replace or remove one or more missing teeth you have these two options available for you that is [Dentures And Implants](#). Choosing the correct option depends on many factors such as preference, price, and the health of your remaining teeth and jawbone. Both dentures and implants have their own advantages and disadvantages.

So it is better to discuss with your dentist both the options in detail before deciding which one would be best suitable for you. **Dental implants Houston** suggests exploring other alternatives to dental implants and dentures, such as dental bridges.

## What are the possible risks and complications associated with dental implants?

Just like other surgical procedures dental implant surgery also has its risk and complications to the patient or to the success of a dental implant. Careful planning is important to ensure the patient is healthy enough to undergo oral surgery. Fortunately, the success rate of dental implant surgery is quite high but still, the risk of infections or treatment failure remains. Some of the risks are mentioned below

- Allergies
- Bleeding disorders
- Infections at the implant site
- Failure of dental implant
- Overloading of dental implant
- Damage to the surrounding area or nerve
- Poor positioning of dental implants
- Sinus problems
- Injury or damage to surrounding structures
- Poor bone quantity or quality

## How expensive dental implant procedure?

The [tooth implant cost](#) of a single dental implant can differ depending on the region and who is on who is doing the procedure. A general cost estimated for a single implant is somewhere around \$3,000 to \$4,500 approximately. This cost includes all the components, surgery for placement of an implant, and the artificial crown. dentist implant near me provides some plans and discount offers for the patients who pay in cash. Dental insurance hardly covers dental implant procedures and even if they do it will be to a limited extent. Dental implants have become the favored option because they offer a conservative approach and provide faster and more effective results with a higher success rate.
