

What Are The Types Of Dentures?

The denture is a partial denture solution that replaces lost teeth and soft tissues. Full and partial dentures are the two main types of [dentures near me](#) available. Complete dentures are employed when all teeth are lost, while partial dentures are often used if some natural teeth remain. If you are one of the people considering dentures, you need to learn more about dentures. In this article, we have mentioned some types of dentures below, which will help you select the best suit for you.

1. Traditional complete full dentures:

Complete dentures are available in two designs: conventional and instant. A typical denture is prepared for implantation in the mouth approximately eight to twelve weeks after the tooth extraction, and the gums have started to heal.

2. Partial dentures:

Partial dentures are employed when a patient has natural teeth, such as one or more teeth in the upper and lower jaws. A pink-colored base is joined to a metal component. The denture is kept in position in the mouth by these two pieces. These partial dentures are comfortable and detachable, delivering you to replace these whenever you want. Partials are made of all-acrylic or acrylic substances, which helps avoid teeth sliding.

3. Snap-in dentures:

Snap-in dentures are either stabilized by dental implants or anchored to existing teeth. These dentures are incredibly stable. This denture's equipped with locator attachments that snap onto locator receptors. It makes it extremely easy to put them on and remove them when the need arises. These can only be used if the patient's bone structure is still sturdy enough to take the implant.

4. Implant-supported dentures

A dental implant is secured with the denture in implant-supported dentures. This denture provides a substantial level of assistance for a stable foundation, allowing the denture to remain in place. Implant-supported dentures also have a natural appearance and will survive long.

5. Removable Partial Dentures

RPDs (removable partial dentures) are used to restore only a few lost teeth. RPDs are made up of replacement teeth bonded to a gum-colored plastic foundation. Detachable partial dentures are attached to a cast metal framework for further stability, which helps in restoring your teeth's natural appearance and function. RPDs can be removed and changed at any time. Patients who aren't potentially suitable for an implant-supported bridge are often given this option.

How are dentures different from veneers?

Veneers near me don't require the removal of any teeth as veneers are commonly used to conceal tooth chips, stains, and fissures and close gaps between teeth, like crowns. On the other hand, dentures can be fixed or removable, partial or complete. Suppose you want to see a significant difference between both dental appliances. Witnessing the difference between **veneers before and after** or dentures before and after images, make sure to search on the web for it.
