

When Do Dentists Recommend Tooth Filling?

A tooth filling is one of the most popular procedures used to repair tooth decay caused by bacteria. A tooth filling works as a support to the tooth that is damaged. The procedure is not painful and takes an hour to complete.

[Cavity filling](#) is more common in children, and filling can help prevent further damage to your teeth. Usually, dentists remove the decayed part of the tooth and fill the cavity with the filling. The tooth may get damaged further if it is left untreated. The tooth will need support to function correctly and withstand biting or chewing, so the dentist recommends a **tooth cap** for the tooth to support it, called a dental crown. Dentists restore the tooth with the help of the crown if half of the part of the tooth is damaged due to a cavity or fracture.

These tooth-colored fillings are used to fix the cracked, broken, or chipped teeth worn down from misuses like biting nails or tooth grinding.

What are the different types of fillings?

When you visit a dentist for tooth decay or broken or cracked tooth, your [Cosmetic Dentistry Near Me](#) may suggest the following filling options. Some of the most commonly used options include the following materials:

Silver-color fillings.

Silver fillings are metal amalgams combining mercury, silver, tin, and copper. It is more durable than tooth-color fillings and affordable than other filling materials. Many people are concerned about mercury content, but there is no proof that amalgam fillings are damaging.

White tooth-colored fillings (composites).

They are a combination of acrylic resin and glass or quartz particles. This substance may cost more but lasts slightly longer than metal amalgams.

Gold fillings.

While more expensive, these gold, copper, and other metal alloy are strong. But these don't appear natural. Following the dentist's imprint of your tooth, gold fillings are often created in a dental laboratory.

Glass ionomer fillings.

These tooth-colored fillings are comparable to composites in strength but are less durable. They are made of fluoride-containing glass and acrylic, which can help prevent cavities. They cost more than amalgams and are often used on a child's teeth.

Porcelain fillings.

These are expensive as gold fillings, but they appear more natural. The **dentist near me** will make it in the lab after the dentist imprints your tooth.

Does a crown need any special care?

You need to take care of your teeth as well as the crown. Taking care of a crowned tooth can be more exceptional. The underlying tooth should be guarded against decay and gum disease. You should keep your regular dental hygiene habits in your routine to keep the crowned tooth healthy. These habits include brushing your teeth twice daily and flossing once daily, particularly in the crown part where your tooth meets your gum. Moreover, to prevent the porcelain from breaking or cracking, refrain from biting on hard objects when wearing a porcelain crown. Avoid chewing ice, or popcorn, biting on other hard objects, or using your teeth as an opening tool.

In Conclusion:

Wearing crowns need care and maintenance; follow your daily habits. If you have any problem or pain, contact your **Emergency Dentist** and book an appointment as soon as possible.
