

WHAT SHOULD YOU KNOW ABOUT TOOTH EXTRACTION?

A wisdom tooth can be removed by an oral surgeon. The following dental surgery is performed by the surgeon itself and is completed in a single visit. If you are at higher risk of all of your wisdom teeth, professionals will recommend oral surgery. If the infection is mild, your dentist may wait for the surgery until the infection is not cleared up itself. In such cases, doctors will prescribe you antibiotics to heal these complex factors. If the problem is uncontrollable, you will require an **Emergency Dentist**.

Wisdom Tooth Extraction: What To Expect?

Most people don't get wisdom teeth that generally eject between the age of 17 and 25. Despite the age they grow, most oral & maxillofacial surgery centers will most likely prescribe removing it for different reasons, such as impacted wisdom teeth trapped in the gums, misalignment, decay, or tight spacing. Such conditions need an [emergency dentist near me](#).

Here are a few things you should understand about the routine wisdom tooth removal procedure.

Before Surgery:

As you start encountering discomfort in your mouth, quickly meet your dentist. If your wisdom teeth are to be eliminated, he/she will transfer you to an oral surgeon. Some skilled dentists also can pluck wisdom teeth by themselves.

The treatment starts with a pre-surgery arrangement, where you will be required to present the surgeon with your medical history and discuss and agree on the extraction procedure.

Come along with a family member or a friend to be with you on the surgery day. You should have someone to take you home. Take a day off to rest. Best of all, if you can take leave for some days to heal. Practically in notably all cases, wisdom tooth elimination methods are performed as outpatient procedures. That means you can go back to your home the same day after the surgery is being completed.

During Surgery:

As soon as you get into the dentist's office, the dentist's team will lead you to the examination room, where they will step you through the wisdom teeth extraction procedure, and then they will provide you anesthesia. Based on your current condition, you will be provided any of these three types of anesthesia-

General anesthesia - It will guarantee that you are completely under throughout the extraction process.

Local anesthesia - It will numb your gums. The oral surgeon can also supply you with nitrous oxide, which will help you rest. It will keep you alert throughout the whole process, but you will not experience the pain.

Sedation anesthesia - It is a composition of IV sedation with local anesthesia. This composition will help you feel relaxed and might even get you to rest throughout the process.

Reaching the next stage, your oral surgeon will start the procedure of pulling out your wisdom tooth. During this oral surgery, you might feel compression or pulling sensation if you are not asleep. It's fine! You will not feel the pain.

The surgeon may also cut your gums or jawbone to eliminate the tooth if required. In such cases, you are most prone to get dissolvable stitches. Altogether, the extraction process, on the whole, should not take more than an hour.

Wisdom teeth removal recovery:

After finishing the wisdom teeth extraction surgery, you will be required to relax until you wake up from anesthesia and feel active to go home. You might feel some uneasiness or soreness for a few days after the surgery.
