

# What Can We Expect From The Dental Implant Procedure?

A dental implant is an artificial structure that acts as a tooth replacement. A dental implant can provide support for one or more teeth. When a tooth's root fails, you can replace it with a titanium screw. It is inserted into the jawbone similarly to a tooth root. The surgeon at [Dental Implants Houston](#) places a dental implant into the jawbone using devices and tools that resemble screws. The dental implant is the anchor for a crown, a type of artificial tooth.

The dental implant and the prosthetic tooth are joined by a component known as an abutment. Dentists design the crown for the individual to fit perfectly in their mouth and complement their natural tooth color. Crowns have a natural feel, appearance, and performance.

Is the dental implant procedure safe, and how long will it last?

According to a **dentist implant near me**, Implants are a tried-and-true, safe procedure. Like natural teeth, implants will likely endure as long as you take care of them, which is probably accurate. A dental implant procedure is safe if a trained and experienced surgeon or dentist completes the process. Additionally, it is the only effective dental restoration method that allows or promotes the growth and preservation of the jawbone.

According to a dentist who does **Dental Implant Dentures**, The critical determinant of how long your implants will survive is how well you take care of them and if you attend your scheduled maintenance appointments. Your implants will acquire a coating if you don't care for them, just like you would with neglected natural teeth. Left untreated, gum infection, bleeding, inflammation, and general discomfort can result in gum infection. All of these dental issues are possible with natural teeth.

## Do dental Implants causes pain?

A **Dental Implant Dentist** typically uses a simple local anesthetic while placing an implant, which is frequently more direct than extracting a whole tooth. While there won't be any discomfort or pain at the time of the procedure, you might experience some discomfort a week afterward, much like after an extraction.

If you are highly anxious or the case is complicated, your dentist may occasionally give you a sedative. They rarely use general anesthesia for dental implants, typically reserved for complex situations.

## How long does the dental implant procedure usually take?

Your dental team will provide a strict timetable before the treatment begins. You can put some fake teeth can even now alongside implants. Ask your dental staff if you're unsure whether these are right for you. They fix the artificial teeth three to four months after the placement of implants. Your dental professional team will be able to tell you how long your treatment will take if it takes longer than expected.

## What happens after the procedure?

After they place your dental implants, the bone in your jaw needs to grow onto them and close to them. It typically requires several months. They can sometimes fit the false teeth earlier because the implants may be stable enough when implanted. You might use a temporary denture while having one, two, or three teeth replaced. While your implants are healing, you can continue to wear your complete dentures if you currently have them.

## Conclusion

From the above-provided details, we can say that the above article gives us valuable insight into the dental implant procedure. It shows the various informative aspects of dental implants.
