

What to Know About Dental Implant Risks and Complications?

Dental implants can effectively replace adult teeth that have been lost or damaged. To replace a missing tooth, [Dental Implant Specialist](#) will drill a metal post into your jawbone. Then they place a crown on the top of your teeth, giving you a more natural-looking smile. Implants can help you eat and chew your food quickly and strengthen your hard bite.

Implants are preferable to dentures or bridgework when they function as intended. Dental implants can be more comfortable and durable than removable teeth. Still, they also require many treatments and have a small risk of problems.

How Do Dental Implants Work?

[Dental Implant Dentist](#) might advise implants if you are missing one or more teeth and your jaw is moving forward. All this will permanently fill your lost teeth. As robust as natural teeth, implants are durable, long-lasting, and can last a lifetime. The procedures for dental implant surgery are as follows:

If you have a damaged tooth, your dentist suggests teeth extraction, giving them time to recover before the following surgery.

preparing the jaw

A **Dentist In Houston** will check to see if the jaw bone in your mouth is sturdy enough to hold an implant once you have recovered from the extraction.

You could require a bone graft to enhance the density and encourage more bone formation. You'll have to wait a while before the subsequent procedure if you decide to acquire a graft.

Placing an implant

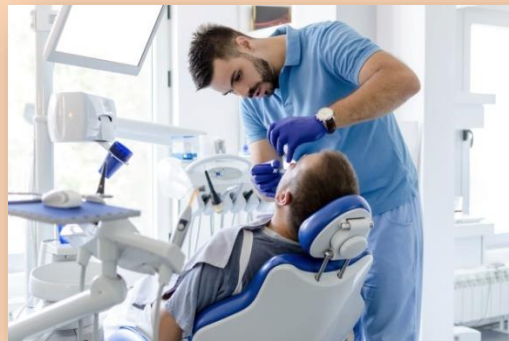

Oral surgery is required for implant installation. The gums will be sliced open by your dentist, exposing the jawbone. The metal implant foundation will be inserted during a bone-drilling procedure. It could take many months for the bone to develop around the implant and firmly retain it.

location of abutments

As soon as the implant has bonded to your jawbone, Your dentist will attach an abutment that rests above your gum line. Sometimes the abutment and implant are inserted simultaneously, and your artificial tooth will eventually be supported by the rod.

positioning of artificial teeth

A crown that looks like your natural teeth and is well-fitted is created by your dentist using the impression to provide both an aesthetic and functional look to your teeth. When the permanent crown is prepared, the dentist will affix the abutment.

What Issues Can Dental Implants Cause?

Sometimes, dental implant placement by your dentist could go wrong. A complication may arise due to the implant's placement or angle. Because it's possible that the implant won't correctly integrate with the bone, will be too close to neighboring teeth, or may become loose or hurt. You might need to have the implant removed or replaced if this occurs. Before obtaining a new implant, you should seek a different [Dental Office Houston](#) for the issue.

Conclusion

Suppose you have a missing or gap between the teeth. In that case, you should consider visiting a dentist to know the proper treatment and diagnosis. Also, you should ask what the [Dental Implant Dentures](#) treatment pros and cons are.
