

Crown Lengthening Surgery: What Are The Benefits Of Dental Crown Treatment?

There are circumstances when not much tooth shows up above the periodontal. This circumstance influences the gum tissues to support [dental crowns near me](#) or dental filling. This happens due to two common reasons:

- When your tooth breaks off at the periodontal line
- When crown or loading gets dislodged from the tooth resulting in tooth decay

So how this **crown lengthening surgery** can assist you in regaining the missing tooth?

Dental Crown Lengthening Procedure

In order to achieve the desired results, your oral cosmetic surgeon will remove some periodontal cells which will expose a considerable quantity of teeth. When this is done [dental crowns Houston](#) specialist will place a filling or crown in an

effort to fix the distorted tooth. You must stumble upon a lot of individuals who have too many periodontal cells bordering their teeth. This problem is called a gummy smile. The whole idea of the dental crown lengthening treatment is to fix this problem.

Prior to going through the dental crown lengthening treatment, you will have to go to a Periodontist. Right here your case history and X-rays will be reviewed and after that, a certain date of a crown lengthening surgery will certainly be chosen. You will likewise go through a dental cleaning procedure to ensure that any kind of discolorations can be removed.

Nevertheless, before all this, your dental expert will confirm whether your tooth needs a crown or otherwise. If it does then the specialist for dental crowns near me will certainly fix a short-lived crown. The temporary crown will help in shielding the tooth. The benefit of the treatment is that it becomes somewhat easy due to the fact that the Periodontist will certainly have the ability to determine the amount of soft tissue or bone to be gotten rid of.

Recovery Period

The recovery time for this procedure is three months and afterward, your dental practitioner will certainly again prepare the tooth. A new short-lived crown will certainly be made to fit the lengthened tooth. After all this, the final crown is made.

Even if you need to undertake the treatment on one tooth, crown lengthening surgery will certainly be executed on the nearby tooth also. This is helpful and permits the periodontal tissues to be improved. In order to draw the gums away,

your Periodontist will make cuts on your periodontal. This subjects the origin of the tooth and the bone which borders it. Besides this, your periodontist will certainly wash the surgical location with sterile seawater and periodontal will certainly be sewn.

What can you eat with a permanent crown?

When you obtain your temporary crown, you will certainly require being very mindful of the foods you eat. Additionally, when **eating with permanent crowns**, you'll need to keep away from the exact same foods for a couple of weeks to allow the crown to work out in your mouth.

Hard foods, such as hard candies, nuts, and crunchy vegetables must be avoided for some time. Chewing ought to happen on the opposite side of the mouth to the temporary crown.
