

Why Are Dental Implants Considered Important In Dentistry?

Dental implant surgery involves replacing tooth roots with metal, screw-like posts and missing or damaged teeth with artificial teeth that resemble natural teeth in appearance and function. The absence of natural tooth roots prevents the construction of dentures or bridgework tooth replacements. [Best Dental Implants](#) surgery can provide a welcome alternative to ill-fitting dentures or bridgework.

The type of **Dental Implants Near Me** they will use, and your jawbone's health will determine how to perform the procedure. There may be various processes involved in dental implant surgery. The main advantage of implants is the reliable support they provide for your new teeth, a process that necessitates that the bone close securely around the implant. Due to the long period of bone healing, the process can take several months.

Why do they perform dental implant surgery?

Dental Implants Houston Tx dentists surgically place the dental implants into your jawbone, acting as the roots of missing teeth. The implants won't fall, create noise, or cause any harm to your bone the way fixed bridgework or dentures might since the titanium in them merge with your jawbone.

Additionally, unlike your teeth, which support conventional bridgework, the materials cannot deteriorate. According to [Houston dental implant center](#), you might benefit from dental implants if you:

- Have a jawbone that reached its normal total growth

- Have single or multiple missing teeth
- If you have healthy oral tissues
- Have an adequate amount of bone to secure the implant
- Dont have a health condition that will affect bone healing.
- If you want to improve your speech
- or are unable to wear dentures
- Are you willing to commit several months to the process
- Dont have a habit of smoking.

How do they prepare for the procedure?

Because **affordable dental implants near me** need one or more surgical procedures, you must have a thorough evaluation to prepare for the process, including reviewing your medical history.

Review of your medical history

Any medical issues or problems you have, along with any medication, OTC, and also dietary supplement use, should be discussed with your doctor. Your doctor might advise taking antibiotics before surgery to help avoid infection if you have specific cardiac issues or orthopedic implants.

Comprehensive dental exam

The **best implant dentist in Houston** may take some 3D mages and X-rays of your jaw and teeth. And also make models of your teeth and jaw.

Treatment plan

They will also customize a treatment plan that considers essential factors such as how many teeth need replacement and the condition of your jawbone and remaining teeth.

What to expect from the procedure?

They perform dental implant surgery as a series of outpatient treatments with recovery time. Also, several steps go into installing a dental implant, including

- Removing a damaged tooth
- Jawbone grafting preparation, if necessary.
- Installing dental implants
- Bone development and repair
- Location of abutments
- Positioning of artificial teeth

The entire process might take months to complete, and most of the time might be spent resting and keeping an eye out for the growth of new jaw bones. You may occasionally mix specific steps depending on your circumstances, the exact procedure, or the materials used.
