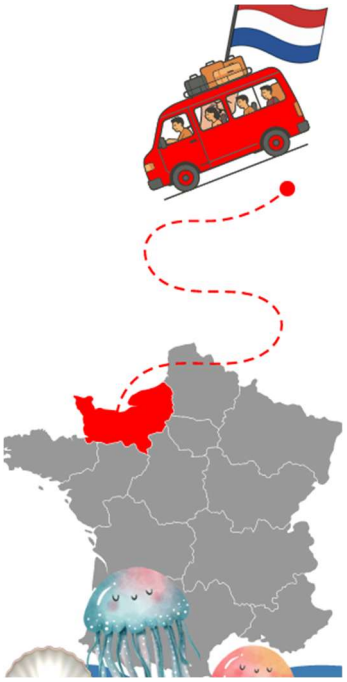
# Normandy Carrefour project WaterWise,

## seen trough the eyes of the Netherlands

## 2026



We went by bus with 2 teachers and 14 students to France

The project about water is very accurate. We thought of the water problems in the Netherlands before coming to France and we were learning a lot in France about different problems with the water quality and wisely use. Even the ivory cost was discussed. We found out a lot off simultaneous problems but also different problems because of the water heights in the different countries.

After a lovely European diner, we worked on Tuesday at the WaterWise puzzle. It makes us aware of the sources where the water comes from and where it stays. Only 1 % off all the water is usable for us.

We have seen in the other days some great development about rewilding the rivers, went to a presentation of aquatic environmental technicians , tested the water quality ourselves, built our own pound, see the water recycling of Honfleur and make a visit to the school at Vire.

The experience for the students was great; some never been to France, found it difficult to speak in an other language but they all tried, made new friends and were very pleased to took part off this amazing journey.
