

When Does A Dental Abscess Need An Emergency Dental Clinic?

An abscessed tooth is a fluid sac of pus that develops in different parts of a tooth as a result of bacterial infection which is also called a [dental abscess](#). An abscessed tooth can cause mild to extensive pain that sometimes can reach your ear to the neck. If it is left untreated it can cause serious life-threatening problems. This kind of situation requires an **Emergency Dental Clinic Near Me**.

There different types of dental abscesses depending upon the location:

The three most common kinds of dental abscess are:

Periapical abscess: It forms at the top of a tooth's root.

Periodontal abscess: This type of abscess is formed on the gum following the root of a tooth. It may spread around the tissue and bone.

Gingival abscess: It can form on the gums.

Other Indications may include:

- Severe pain that expands to your ear, jaw, or neck.
- It gets worse when you rest.
- Extensive pain when you are chewing or biting.
- Redness on the face with swelling.
- Red swollen gums.
- Teeth sensitivity.
- Discoloration of the teeth.

- Bad smell.
- Bad taste in your mouth.
- Sore lymph nodes in your neck or below your jaw.
- Can cause fever.

When an abscess explodes, you will feel immediate relief from severe pain. But there can form a sudden bad taste in your mouth as the pus drains out.

Germs growing into your teeth or gums leads to a dental abscess. Though, the explosion depends on the type of abscess.

In the case of **Periapical abscess**, germs, and bacteria enter the pulp within your teeth through a cavity. The tooth pulp is made up of sensitive nerves, connective tissue, and blood vessels.

If it is a **periodontal abscess** it is a type of gum disease that can be formed due to serious injury.

In **Gingival abscess**, it happens when a toothbrush bristle gets embedded in your gums.

If you are facing one of these problems, you should visit [Emergency Dental Clinic](#).

Treatment by Emergency Dental Services Near Me:

Treatment for an abscessed tooth includes cleaning up the infection and getting you relieved from the pain. Your dentist will start a dental X-ray based on the patient's symptoms to examine the expanded infection area.

Steps included in the treatment:

- The dentist will make a small incision in the abscess to remove the pus to clean the area with a saline solution.

- The professional will perform a root canal procedure to remove the infected pulp and after the procedure is done, he/she will seal the wound and place a crown over it to make teeth stronger.
- If the infection has spread out of the abscessed area or your immune system is weak, the dentist may prescribe you antibiotics to help in clearing the infection.
- If the abscess is formed due to a foreign object in your gums, the professional will eliminate it. After the removal, he/she will finish the cleaning process and give you an anti-inflammatory drug like ibuprofen to relieve the pain.

If you notice an abscessed tooth, consult your dentist immediately to get rid of it before it turns into a health hazard.
