How is periodontitis treated?

We have mentioned some effective **Periodontitis Treatment** below that can restore the ability of tooth after treatment:

- **Scaling and Root Planing:**

This treatment involves deep dental cleaning which offers removal of plaque and tartar from your gums with the help of a hand scaler and ultrasonic instruments by your dentist.

- **Gum Grafting:**

In this treatment, your dentist removes healthy gums tissue from one area of your mouth and places it where it's needed with the help of lab-processed donor tissues. This is the most common treatment among patients when it comes to periodontitis disease.

- **Periodontal Laser Treatment:**

In this treatment, the dentist removes infected gum tissue with the help of a laser which won't cause pain, discomfort, and major gum shrinkage.

- **Dental Implants:**

Dental implants are one of the most preferred treatments for curing gum disease by replacing the roots of the tooth with a plate of titanium by inserting it into the jawbone through the gum line.

- **Crown Surgery:**

In this treatment, your dentist will remove and offer an artificial crown to your gum and bone tissue with the help of cosmetic tooth surgery.
