Who needs a dental bridge?

The dental bridge may support that you have a missing tooth. The general causes of missing teeth are tooth decay, injury, or gum diseases. Also, if you are born with missing teeth due to a congenital situation. To get **dental bridges near me**, one may need to have healthy teeth on one side of the missing teeth.

What does a dental bridge look like?

Usually, the dental bridge available in the [dentist office near me](#) looks like-

- Pontics - It is the false tooth that fills the gaps and bonds to the crowns
- Abutment teeth - A dental specialist puts the two crowns together on the teeth or the side where there is a gap. These anchoring teeth, or teeth supporting, would be quite dental implants or natural teeth.

What happens in the process of dental bridges?

The one may generally need to have at least two appointments-

- Preparation of abutment teeth

At your first visit, the dentists will provide the reshape of the abutment teeth. It will extract the enamel and dentin parts of the teeth, so there is room for the crown.

- Impressions

The dentists will take an impression of the teeth or digital scan. A dental lab uses the scan or mold as a tool to design the dental bridge, crowns, and false teeth. It is a temporary bridge to cover the disclosed area in the mouth while the lab creates bridges.

- Permanent placement of bridges

At the time of the second visit to the **dentist office open near me**, the health care will eliminate the temporary bridge and place the new permanent bridge. The dentists would carefully check the bridges and make the adjustments that fit you comfortably.
