

Carbon footprint

Carbon footprint is an indication that aims to measure the impact of on activity on the environment and more specifically the greenhouse gas emission associated with that activity.

Carbon footprint statistics: energy transformation 11%, transport 28%, tertiary residential 20%, manufacturing 20% and agriculture and forestry 21%.

The principal cause of carbon footprint is the transport,

tertiary residential, manufacturing and agriculture and forestry.

Transport because everyone use a car for short trip or for go on works but we could take public transport for go to works and us bike for short trip.

The tertiary residential because all people use electricity or gas for home for reduce this may be to put of the light after living a room or put of the power point after stop watching TV.

These increase in gas emissions mechanically cause global warming. For this we make in place a petition for buy a new public transport.
