

Today, I want to inform you about the disappearance of the polar bears. The cause of their disappearance is global warming. Because of that, their habitat, the ice pack, diminishes near 13.4% every ten years. If the ice pack continues to melt, then it will be contracted by more than 40% in the middle of the 21st century and the population will diminish more than 2/3. Let me explain: with the ice pack reduced, the hunting period will be reduced as well. Because of the hunger, the polar bears will be weaker, reproduction will be very difficult and the population will diminish. The hunger will also cause the death of the babies because of the lack of nourishment or adult polar bears will probably eat them.

To help polar bears, I organize an art exposition at 5 dollars the entries. The money will be given to Polar Bears International.
