

**The problem to be studied is floods.**

**The indirect overflow of a water reserve following the rise of groundwater or water through pipes. The accumulation of runoff following heavy rainfall.**

**Flooding is a natural phenomenon likely to cause loss of human life, the displacement of populations, to have an impact on human health, property and network. It can also harm the environment and seriously undermine economic development.**

**To solve the problem, we can create an association to raise funds and help people who have had their homes destroyed by floods.**
