

#SeeYourPlanet

Hello everyone! We will I introduce you the global warming, his causes and what can we do for avoid it.

The global warming is caused in the first place by the transportation fuel (Car, boat, aviation etc...).

Is also caused by the overproduction of energy (heater, electricity).

There is many consequences about this, the meteorological perturbation is the most dangerous the global warming cause many tsunamis, forest fires, the drought, storms, floods etc...

The global warming increase the level of the sea and his acidification.

The acidification limits the capacity of the planet to create the CO₂.

But we have solutions against the global warming the priority is to reduce the greenhouse gas.

For do this we should use renewable energy and avoid the fossils fuels.

Also we must reduce our carbon footprints in avoiding the waste of food.

For the future we should transform our society for they supports the ecology because many society pollute the planet so far.

Don't worry we can take actions against this problems with our talents and with our technology.

The idea is to create contents with our capacity we can take picture, photo shop, take videos, painting who see the bad future of our planet under the [#SeeYourPlanet](#) on internet for the facility to upload our contents.

For example in France the temperature will be at 50°C so we can paint a France with forest fire and drought. The goal are to create an ecology movement and wake up our mind.
