

# What Are The Types Of Dental Fillings?

If you go to a **dentist near me**, he would before filling cavities numb your teeth, gums, and the neighboring skin to avoid and reduce distress and pain during the procedure. Next, he will dig out the decay in the tooth and restore it with a mixture. This process would take only a few minutes. Once this is done, your mouth will continue to be numb for a few more hours. Although, there are not any notable risks connected with filling decays, but, you should keep your dentist's connection data in case you might have any problems or difficulties. Visit the [Dental Clinic Near Me](#), to get your cavities filled.

The most frequent use of tooth fillings is to fill a decay in the tooth. But tooth fillings are also used to fix damage to teeth, which is generated by grinding of teeth or to restore the part of a cracked tooth. Various dental clinics prescribe distinct sorts of dental fillings. The sorts of dental fillings practiced are meant to prevent the tooth from extra decay and damage, and also to build a pleasant sensation when the patient chews food.

The different types of dental fillings

Mainly dental fillings are considered in five types.

1. Composite Fillings - A **Composite Tooth Filling** is acknowledged as the main sort of dental filling material. This dental filling substance essentially consists of various resins, in the **Composite Filling Procedure** the filling is applied to the affected decay area while it is in semi-solid nature. Then, with the use of light blue curing light, the substance's element composition is improved, which changes its physical state. Essentially, the blue light is utilized as an incentive to strengthen the substance to

fully cover up the cavity. **Composite Dental Filling** is mainly worked because it is balanced in color to the shade of the patient's concerned tooth. They are commonly also known as **Tooth-Colored Fillings**.

2. **Silver amalgam fillings** - **Silver Amalgam Fillings** have been used for a long time now to fight tooth rot by packing in decays. Dental amalgam is a substance made from a mixture of various elements, such as mercury, tin, copper, and silver. As the mercury in dental amalgam is in a fluid state, it responds with the other powdered elements to form a binding agent that can be formed to fit in the space vacated in cavities and made to be comfortable in the mouth.
3. Ceramic fillings - this is the most expensive type of fillings. The central reason why they are expensive is that they are charming and long-lasting. Ceramic is a great choice to consider among other different types of dental fillings on account of its tooth appearance form and high stability to abrasion and staining. While somewhat different from the different types of tooth fillings, ceramic dental repairs are known as onlays or inlays. To know more visit the best **Dentist Office Near Me**.
4. Gold fillings - as the name already suggests, gold fillings are very expensive than the various natures of tooth fillings. Gold fillings do not rust and can last up to 15 years or more extra. The sole limitation of gold filing is that it uses a range of appointments to get it correctly fitted into the cavity area. This commonly makes it tougher to fit compared to other types of tooth fillings. To get all your doubts solved visit [orthodontist near me](#).
