What are Dental Bridges?

Dental Bridges are related to as an artificial tooth or teeth (pontic) to design a stunning, strong and more aesthetically charming smile. These prosthetics are employed in cosmetic dentistry to "bridge" the notches anywhere a root or teeth are fasting or eliminated.

Built of two caps, identified as crowns, and an unnatural tooth, a dental bridge is enduringly fixed to abutment teeth that are on both sides of the artificial tooth.

There are three main types of dental bridges:

Permanent dental bridges: Composed of porcelain or porcelain mixed to metal, these prosthetics are bound and unlike removable partial dentures, you can't take them out of your jaws.

Cantilever bridge dental: This sort of bridge is utilized when only individual abutment tooth encloses the open space.

Resin-bonded bridges: This bridge is typically used for your frontal teeth. It is an excellent option when the broken teeth are good, strong and don't have deep fillings. Inquire **Dentists near me** to know what is best for you.
