

## GROWN MEAT :

With the help of the poster below and the text, advertise grown meat in a short video or power point + audio

stem cells = *cellule souche*

Stem cells are special cells that have the ability to develop into many different cell types, from muscle cells to brain cells. Stem cells are divided into two main forms: embryonic stem cells and adult stem cells. The embryonic stem cells are *pluripotent*, meaning that they can turn into more than one type of cell.

There are two types of adult stem cells. One type comes from fully developed tissues, like the brain, skin, and bone marrow. There are only small numbers of stem cells in these tissues, and they are more likely to generate only certain types of cells. For example, a stem cell derived from the liver will only generate more liver cells. The second type is induced pluripotent stem cells.
