If it sounds like spider veins, then it's high time to seek medical treatment with a reputable **vein specialist near me**.

Read the entire article to know about the spider **vein treatment**.

## Spider veins - Definition

Spider veins are those which have a small appearance and widen under the surface of your skin. Some of you think that these are varicose veins, not but they are not. These veins are different as they occur on other parts of the body, and not like the varicose veins that appear only on legs. Usually, spider veins occur in areas of the body which get a lot of sun rays such as hands, face, and arms. Further, they do appear on legs in some cases.

They are known as spider veins because they look like a web structure. These may occur in any part of the body. They have a blemish and unattractive appearance, but they are not hazardous.

If you have spider veins then it is essential that you may need to have a [spider vein treatment near me](#) ASAP.

## Causes of Spider Veins

Although a breakdown in vein valves is likewise involved in spider veins, an enhancement in pressure is the primary cause. Any individual who stands for a long time, for example, teachers and salesmen are bound to raise them because of the additional pressure over long periods on the tissue. Age and hereditary qualities are different variables that can contribute to the recovery.

## Risk Factors Associated with Spider Veins

A **vein specialist** has announced several factors which increase the complications in the development of spider veins. And these are-

- Age
- Sun damage
- Pregnancy
- Hormones
- Blood clots or vein damage in past
- Being overweight
- Genetics
- sitting or standing for long periods
- Excess force in the face, such as powerful coughing, sneezing, or vomiting

## Complications of Untreated Varicose Veins

Normally, the spider veins are painless. It is always too good to check that the spider veins do not lead to many health problems which may lead to trouble.

If they are left untreated then it may lead to more severe problems like chronic venous insufficiency. This is the situation when veins do not work accurately and are not able to deliver the blood from the heart to the legs.
