

What is bbl Surgery?

Brazilian Butt Lift (bbl) is a cosmetic surgery that transfers fat to enhance and reshape the buttock. This procedure involves removing extra fat from one part of a body, for instance, the hips, and then transferring the fat cells to the other part of the body where fat is required, like the buttocks. Liposuction is the procedure of removing excess fat from the body, and through liposuction, the surgeon extracts the fat cells.

This procedure provides a natural-looking, organic enhancement. This is a permanent enhancement, unlike a buttock implant.

Nowadays, bbl surgery is the most widespread cosmetic [buttocks](#) augmentation procedure to enhance your personality.

BBL before and after results:

After having the surgery, you can see the **bbl surgery before and after** results.

You will have a curvier figure and notice that your clothes fit better than before. You will see the difference between your upper and lower body.

Experience a boost in your self-confidence and your body impression.

Brazilian butt-lift procedure

The [bbl surgery](#) procedure involves grafting fat on the buttocks to give natural-looking results. The process involves the following steps:

Firstly, the procedure is performed under local anesthesia, as only a tiny part is transferred. The surgeon will use liposuction to remove the fat from other body areas, such as your hips, stomach, and thighs. Liposuction involves incisions in the skin and using a tube to extract fat from a particular body area. Your

bbl surgeon will remove excess fat from the body and injects the fat into the buttocks, and finishes the procedure by creating a round and complete look that gives a natural look to the buttock.

Both liposuction and fat transfer incisions are completed with stitches, and the scars are tiny. As the syringes are injected, only 2-3 mm, incision scars will be visible. Your bbl surgeon will use a compression garment against the affected areas of the skin to minimize the risk of bleeding.

During bbl recovery

During the recovery, you may feel swelling, discomfort, and the need to take some time off from your daily usual and strenuous activities. After surgery, one of the most necessary things is to avoid sitting on your buttocks for about two weeks to recover. Just follow the appropriate advice of your doctor.

Your surgeon will provide you with a compression garment for atleast two weeks after the surgery. While taking a shower or wanting to wash it, you can remove the compression garment and wear it again. However, avoid swimming for two weeks and let the stitches heal properly.

Conclusion:

The surgeon who performs BBL surgery should be a plastic surgeon with experience in this BBL surgery. Be sure and examine the procedure before going with the surgery.

When you meet your consultation, ask the surgeon about their experience, complications, risks, credentials, and a portfolio of the surgeon where before and after bbl surgery photos of the patient should be attached. Removing excess fat bbl surgery will help you make your physical appearance look great.
