

BLEPHAROPLASTY - FUNCTIONAL AND COSMETIC EYE LIFT.

With the introduction of hi-tech medical services, It has become very easy to restructure or reshape any part of the body. People can enhance part from the toenail to a strand of hair. If the people can bear the cost of such technology to enhance their looks, they can get restructured anything. These procedures are not only used for cosmetic reasons but also for the better functionality of the different body organs. [Liposuction for men](#) is also popular today. Blepharoplasty is one of them.

What is Blepharoplasty?

Blepharoplasty is also referred to as eyelift surgery. It is an eyelid surgery that helps enhance the appearance of the upper and lower eyelids and restores the neighbouring area offering a more rested and alert look.

This cosmetic surgery can improve the look of the various areas by removing extra fat making certain areas puffy. This treatment is usually performed to enhance the sight in old aged people who are unable to see properly due to sagging upper eyelids. However, an eye lift won't get rid of dark circles or other facial wrinkles. It is conducted along with other cosmetic procedures including [Laser Liposuction](#), filler injections, or forehead lifts.

Who is the right candidate?

People with healthy facial muscles and tissues are considered the right candidate for blepharoplasty. Also, who is without serious illness or medical conditions, has no serious eye conditions, etc. Moreover, a person of the age of thirty-five or older with good health can be considered the correct candidate for eyelid surgery. But if the problem is hereditary, you can get the procedure done sooner.

Blepharoplasty procedure:

- The first step of the procedure involves marking the area of the skin with excessive fat and fat bulges surrounding the skin.
- After that, surgeons administer the anesthesia to numb the affected area, then make incisions in the natural crease of the lid to remove excessive skin.
- After removing or relocating the fats, the incision is closed through the sutures. The scars due to incisions fade away gradually with time.

- When surgeons remove the lower eyelid fat without leaving scars behind and stitch for enhancing the look of the lower eyelid, known as a transconjunctival blepharoplasty.
- Lastly, restructuring of external skin is done using a carbon dioxide laser or a chemical peel. This also helps in quicker eyelift surgery recovery.

Last blepharoplasty recuperation with stable outcomes may take some time, while the underlying recuperation of expanding and wounding may require 1 fourteen days. Factors like life systems of the eyelids, nearby tissues, and age, and skin quality assume a critical part in influencing utilitarian and corrective results.

Eyelift surgery cost:

Eyelift costs may vary for each patient. It relies on whether you require only an upper lid or lower lid or both for correction. However, patients may expect between \$3,000 and \$5,000.

Upper eyelid or lower eyelid surgery is valid for at least 5-7 years. Lower eyelid surgery unusually requires to be renewed. Of course, your eyes will still mature after the procedure.
