

# What is eye lift surgery?

Eyelid surgery is also called blepharoplasty, and this is a surgical process to enhance the appearance of your eyelids. Lower eyelid surgery, also known as lower lid blepharoplasty, improves the sagging, baggy, or wrinkles of the undereye area. Some prefer this surgery with the facelift, brow lift, or upper eyelid lift. This surgery is performed on both the eyelids and lower eyelids.

[Eye lift surgery](#) makes your eyelids look younger, and **eye lift** surgery helps rejuvenate the surrounding area of your eyes.

A more steady and mild cosmetic procedure called [Vaser Liposuction](#) removes fat more calmly and requires a proficient and experienced provider to complete the surgery. **Skinpen** is also a device that is used to tighten the skin.

## What eyelid surgery can treat?

- 1.
2. Eyelid surgery can rejuvenate the eye area and contour the natural look. Eyelid surgery can treat loose or sagging skin around your eye area on the upper eyelid.
3. Sometimes lousy eyesight and the fat deposit around the eyelid cause puffiness to appear in the eyelids.
4. If you have bags under the eye, you can treat them with eyelid surgery.
5. Wrinkles or excess skin on the lower eyelids.

## Procedure for lower eyelid

There are many surgical procedures for the lower eyelid, and it usually depends on what type of surgery you want for your under the eye that suits you better.

Before the surgery, the surgeon will mark the area of your eyelid so that the surgeon can easily make incisions on your eyelids.

After marking a mark on your eyelid, the surgeon will give general anesthesia to make the patient completely asleep or unaware of the ongoing procedure. This procedure may be performed under general or local anesthesia.

The surgeon will perform this procedure under general or local anesthesia. General anesthesia is given, so the patient is completely asleep and unaware of what is happening during the process. Local anesthesia permits a patient to be open-eyed, but the eye area has been numbed, so they don't sense what the surgeon is

If you have lower eyelid surgery, the surgeon recommends local anesthesia. During the lower eyelid surgery, the doctor can check the eye movement so it does not cause any side effects to the eye. The surgeon will cut around the lower eyelid, remove the extra skin and fat from the eye area, and stitch it back to give that flawless skin and uplifted appearance.

**Visit your doctor instantly if you find any complications around your eye area like:**

1. Bleeding from the skin around the eye area.
2. If you feel feverish.
3. If Pain is getting worse instead of getting better over time.

Remember that your skin starts aging after age, so your skin may begin to look wrinkled and sag again with time.

### **Conclusion:**

Consider your reasons before moving forward with the surgery. It is better to discuss your goals with your surgeon. Tell every detail about your eye health so your doctor can tell you whether your decision is correct or not for eyelid surgery. Consult the [eye lift surgery cost](#), view **Liposuction Before And After** images, the risks, and the procedure of eye lift.

Consult with your plastic surgeon's office to determine your **eye lift cost**.

The **eyelid surgery cost** depends on the experience of the surgeon.
