

What To Know About Breast Augmentation And Reduction Surgery?

You'd like to change your cup size by one or more sizes. You want implants to give your body more curves or to ease the strain on your back after having breast reduction surgery. It sounds fantastic. However, you'll want to know what to anticipate and how those adjustments will fare over time and know about [breast lift before and after](#) details. So, here are some important facts about breast augmentation and breast reduction procedures.

Implants are temporary

Breast implants are temporary, and it is the first thing the plastic surgeon tells a woman who approaches him for implants or **Breast Lift**. Implants usually last at least 15 years. So, depending on your age, you should typically plan for a few additional surgeries if you visit your plastic surgeon annually for an examination to ensure that your implants remain sturdy and undamaged. You can see the clear result through **breast lift before and after** pics.

Breast reduction usually lasts.

Your breasts will determine how long your results last. Breast tissue comes in three varieties: fatty, fibrous, and glandular. You would unlikely grow additional glandular or fibrous tissue after surgery. Following surgery, you might develop extra fatty tissue in your breasts if you put on weight. Because of this, it is best to have [Breast Reduction](#) surgery when your optimal weight is stable.

What are the types of breast implants?

Your surgeon first places an empty in your breast before adding sterile saltwater. However, a large number of people now have silicone implants that are already filled with silicone gel. Additionally, there are several silicone implant varieties, and some are delicate, and "Form-stable" describes others.

Because they maintain their volume and shape even if the shell is damaged, the bottom of form-stable implants is fuller, making them appear more natural. But unlike round ones, if they spin, they can alter the breast's natural form. You can click **Breast Augmentation Before And After** photos to see a clear difference.

[What happens after the breast augmentation and reduction surgery?](#)

You can usually return your home the same day after breast augmentation surgery. It's highly uncommon for an implant treatment performed for cosmetic reasons to necessitate an overnight stay, according to Hansen. Make necessary arrangements for someone to drive you home following the procedure and stay with you for at least one night. You should strictly avoid vigorous activity for a few weeks since your breasts may feel stiff or uncomfortable for up to five days.

Your surgeon might advise wearing an elastic bandage or specialized bra after breast reduction surgery to reduce swelling. They could also insert a temporary tube under your skin to drain blood or fluid.

[How many sizes can you reduce in the breast reduction procedure?](#)

On average, most women aim to lower their breast size by at least one or two cup sizes. The quantity of breast tissue you remove should ideally result in a natural-looking silhouette, which means that it will balance your body's proportions. To get the desired aesthetic result, women with particularly enormous breasts may need to lower the size of their breasts by extra cup sizes.
